

Crimes that the police do not know about and that do not show up in police statistics are called the dark figure of crime.

1. What is the "dark figure of crime"?
2. We know there is variation among crime types in the likelihood that a crime is reported to the police. Which of the following crime types has the *highest* likelihood of being reported to the police?
 - a. robbery
 - b. burglary
 - c. assault
 - ☒ d. motor vehicle theft
3. Suppose the local police department begins a new city-wide neighborhood watch program; after the program has been in place for about a year, we see that crime dropped in the city. Can the police chief legitimately attribute the crime drop to the neighborhood watch program? Why or why not?
4. If a city's police department received reports of 200 robberies in a particular year and we believe that the likelihood a robbery is reported to the police is somewhere between 35% and 75%, then what is a plausible range for the actual number of robberies? $200/0.75 = 266.667$, $200/0.35 = 571.429$ so, the range would be [267, 571].
5. The National Crime Victimization Survey reports estimates of both the number of personal and commercial robberies each year.
 - a. true
 - ☒ b. false
6. A city adopts an aggressive policing strategy targeted at repeat offenders. After implementing this policy for 1 year, the crime rate drops. Which of the following would be most helpful for determining whether the aggressive policing strategy caused the crime rate to drop?
 - a. better measurement of crime
 - b. a longer time period to study
 - ☒ c. studying the crime rate for a similar city that did not implement a new program over the same time period.
 - d. jail/prison data to determine whether more repeat offenders had actually been incarcerated
 - e. none of the above are correct
7. Researchers are generally less concerned about the dark figure of crime for homicide. However, there are other issues. Identify one concern that researchers often have about UCR-based homicide statistics and one concern that researchers often have about NCHS-based homicide statistics.

No, just because a comes before b doesn't mean that a causes b; we would need a control group.

UCR-based homicide statistics are compromised when some police departments don't report their information to the FBI. NCHS homicide statistics can be misleading as a measure of murders because the statistics include both self-defense cases and murders as part of the total number of homicides.
